Against the background of trade conflicts and an increasing number of embargoes that further limit the chances of free trade, companies start looking for alternatives for selling products. The focus of their activities shifts to the ASEAN region, a market with huge potential that is opening up step by step.

During this year's wire Southeast Asia, Kieselstein – a German producer of wire drawing machines – will explore the opportunities the Southeast Asian market has to offer.

Kieselstein's technology is interesting to those wire producers who intend to increase the quality of products and to

make production processes more efficient and flexible.

The company designs high-speed trolley-wire drawing plants. By optimising the cooling concept the plants reach three-times higher drawing speeds than comparable plants in the market, the company claims. This increase in productivity makes the plants an economically highly interesting investment.

Besides the machines, Kieselstein can offer its customers a comprehensive

range of services. It has developed its own app, k.connect, which is supplied with new plants to support the plant operator during the production process, as well as maintenance, servicing and spare parts purchasing.

It has also recently launched a four-step retrofit programme, which includes taking stock of the current condition of the plant to carrying out retrofit measures to modernise the equipment.

Consulting on production optimisation or implementation, support during commissioning, and trial operation complete the range of services offered.
